

Trading forex pairs

What to change so the strategy takes trades on EURUSD, GBPUSD, AUDUSD and the other pairs - and why your gold values show no trades there.

STRATEGY

SMC_Structure_Strategy_v8.3.txt

BROKER

FxPro MT5 via TheConnector

SETTINGS TO CHANGE

6 inputs and 1 Properties box

CHARTS

1 minute, one chart per pair

1 LOT

100,000 units on every forex pair

TIME

about 5 minutes per pair

Run every pair on a DEMO account first. The spreads and commissions shown are examples - type the ones of your own FxPro account. Not financial advice.

SECTION 1

Why gold settings show no trades on forex

Four settings are measured in PRICE. A number that is small on gold is enormous on a currency pair.

Gold trades near **4,300**; EURUSD near **1.08**. A value of **1.0** is one dollar on gold but **10,000 pips** on EURUSD. Three gold values each stop every forex trade on their own:

Gold value left in place	What it does on EURUSD	Audit label you see
Skip the stop if CLOSER than 3.0	Every forex stop (a few pips = 0.0005) is closer than 3.0 - every setup is skipped	CANCELLED - stop too close / too far
Stop buffer 1.0	The stop lands 10,000 pips away; 50 of risk buys about 50 units, which rounds to 0 lots	CANCELLED - size is zero
Spread 0.16	Counted as a cost per unit, 1,600 pips - the size again rounds to 0 lots	CANCELLED - size is zero

How big is a pip

Pairs	1 pip in price	3 pips	30 pips
EURUSD, GBPUSD, AUDUSD, NZDUSD, USDCAD, USDCHF, EURGBP	0.0001	0.0003	0.0030
USDJPY, EURJPY, GBPJPY (any pair ending in JPY)	0.01	0.03	0.30

At FxPro every forex pair is **100,000 units per lot**; the lot step and the minimum lot are 0.01 lot. The strategy detects this by itself from the ticker. The lot step and minimum lot settings are in LOTS, so they fit forex as they are - leave them.

Nothing else changes

Signals, entry rules, target (R), risk per trade, sessions, news windows, weekend rules and loss recovery work the same on every pair. Only the settings in Section 2 depend on the market.

SECTION 2

The settings to change

On each forex chart: open the strategy's Settings (gear icon). Groups are in the Inputs tab; the last row is in the Properties tab.

Group	Setting	Gold (example)	EURUSD, GBPUSD, AUDUSD ...	JPY pairs
20	Stop buffer beyond the CHOCH* level, in price	1.0	0 (or 0.0001)	0 (or 0.01)
24	Skip the setup if the stop is CLOSER than this (price)	3.0	0 (or 0.0003)	0 (or 0.03)
24	Skip the setup if the stop is FURTHER than this (price)	your value	0 (or 0.0030)	0 (or 0.30)
26	Broker spread, in price	0.16	your spread, e.g. 0.0001	e.g. 0.01
23	Charge per LOT, ONE side	your gold charge	your forex charge, e.g. 3.5	the same
30	Symbol to send (blank = the chart's ticker)	blank	blank	blank
Properties	Commission → Cash per contract	0.3	copy the table row 'Paste into Properties cash/contract'	the same

Type the small numbers exactly

Type 0.0001 including every zero. If a box will not keep a number that small (it jumps back to 0 or 0.01), tell me before you go on - that would be a small fix in the strategy.

Each setting in detail

Group 20 - Stop buffer beyond the CHOCH* level, in price

Default: 0

Set: 0 or 1 pip

WHAT IT DOES Puts the stop a little further than the structure level. In price, so a gold value is far too big on forex.

EXAMPLE EURUSD: 0.0001 = 1 pip beyond the level. USDJPY: 0.01.

WHY THIS VALUE 0 is the strategy's default and works; 1 pip only adds a little room against a wick.

Group 24 - Skip the setup if the stop is CLOSER than this

Default: 0 = off

Set: 0 or about 3 pips

WHAT IT DOES Skips setups whose stop is so close that the spread could stop them out.

EXAMPLE EURUSD: 0.0003 = 3 pips. USDJPY: 0.03.

WHY THIS VALUE Your gold 3.0 is 30,000 pips on EURUSD and skips everything.

Group 24 - Skip the setup if the stop is FURTHER than this

Default: 0 = off

Set: 0, or about 30 pips

WHAT IT DOES Skips setups with a very wide stop (tiny position, far target).

EXAMPLE EURUSD: 0.0030 = 30 pips. USDJPY: 0.30.

Group 26 - Broker spread, in price

Default: 0 = not modelled

Set: the pair's spread

WHAT IT DOES Counts the spread as a cost, like commission: the position is sized so a stop costs your full risk including the spread, and the target is pushed out to cover it.

EXAMPLE MT5 → Market Watch → right-click → Columns → Spread. MT5 shows it in points: 12 points on EURUSD = 1.2 pips = **0.00012**. Use the top of the range you see at the hours you trade.

Group 23 - Charge per LOT, ONE side

Default: 0

Set: your FxPro forex charge

WHAT IT DOES Your commission to OPEN one lot; the strategy doubles it for the close. Leave the commission model on 'Auto - per lot, contract size from the ticker'.

EXAMPLE Find it: open 0.01 lot on the pair and close it, read the charge on the statement, multiply by 100. 0.035 on the statement = 3.5 per lot.

Group 30 - Symbol to send

Default: blank

Set: blank

WHAT IT DOES Blank sends the chart's own name (OANDA:EURUSD sends EURUSD). Type a name only when FxPro's MT5 spells the pair differently, e.g. EURUSD.r - and then only on that pair's chart.

WHY THIS VALUE Blank is also the safe choice: a typed XAUUSD copied onto a forex chart would send gold orders.

Properties - Commission, Cash per contract

Default: -

Set: the table row's number

WHAT IT DOES TradingView's own commission for the backtest, per unit. The strategy works out the right number from your charge and spread and shows it in the table row 'Paste into Properties cash/contract'.

EXAMPLE Charge 3.5 per lot and spread 0.0001 give about 0.000085. Your gold 0.3 on a forex chart would cost 15,000 per side on a 0.5-lot trade.

SECTION 3

Set up a new pair, step by step

The same eleven steps for every pair. One chart and one alert per pair.

- 1 Open the pair on its **own chart**, **1 minute**, for example OANDA:EURUSD.
- 2 Add **SMC Structure Strategy v8.3** to the chart.
- 3 Inputs: set the **six settings** of Section 2 for this pair.
- 4 Properties: **Cash per contract** = the table row 'Paste into Properties cash/contract'. Pyramiding **100** and leverage as on your gold chart; Initial capital = your balance.
- 5 Table row 'Ticker - type / 1 lot / symbol sent' must read **Forex | 1 lot = 100000 | sends EURUSD**.
- 6 Table row '**Commission model**' must not be orange (orange = no charge typed).
- 7 Run the backtest. '**Skipped - stop distance / min lot**' should be a small part of the signals, and trades should appear.
- 8 Table row '**Last trade risk**' should be close to your base risk (e.g. 50).
- 9 Table row '**Costs last trade**': red means costs are above 25% of the risk - the 1-minute stops are too small for this pair's costs. Consider a wider minimum stop (group 24).
- 10 Create the pair's alert **on this chart**, **after** the settings: condition **Order fills only**, message **only** `{{strategy.order.alert_message}}`, webhook URL `https://webhook.theconnector.fr/YOUR_ACCESS_KEY`.
- 11 In MT5 on the laptop, add the pair to **Market Watch** and migrate the VPS again, so the robot can trade it. Test on demo first; check the first lot size in MT5 yourself.

The TheConnector tag can stay the same

Every close command also carries the symbol, so one tag (for example smcgold) on every chart is fine. Each trade still gets its own code added to the tag.

SECTION 4

If a pair still shows no trades

Switch on 'Signal audit labels' (group 20). Every signal then gets a label saying what happened to it.

Audit label says	What it means	What to change
CANCELLED - stop too close / too far	A group 24 limit is in gold units, or too tight for this pair	Group 24: forex values from Section 2, or 0
CANCELLED - size is zero	The cost per unit is huge: stop buffer or spread in gold units	Groups 20 and 26: forex values
CANCELLED - below the minimum lot	The size is under group 22's minimum lot	Check group 22 'Minimum lot'; a larger risk or a tighter stop gives a bigger size
CANCELLED - entry beyond the stop	Stop buffer so big the stop crosses the entry	Group 20: 0 or 1 pip
SKIP - outside session hours	The signal came outside 'Take entries from / Stop taking entries at' (group 20)	Nothing - or widen the hours
SKIP - news window / weekend / risk cap	A block you set is active	Nothing - it works as set
REFUSED BY TRADINGVIEW	TradingView would not fill the order	Properties: Pyramiding 100, leverage high enough (e.g. 100x)

Still nothing?

Send me a screenshot of the strategy's table on that chart and of one audit label. I will tell you what the cause is and how to fix it before any file is changed.
